## MEMORANDUM

To: Owner/Operators of hazardous liquid and natural gas pipelines not subject to the Security Directive (SD) Pipeline-2021-01 and Pipeline-2021-02 series

Date: February 16, 2022

Subject: Information Circular (IC) to Enhance Pipeline Cyber Security (IC Pipeline-2022-02)

Attached to this memorandum is Information Circular (IC) Pipeline-2022-01: Enhancing Pipeline Cybersecurity. This IC applies to owner/operators of hazardous liquid and natural gas pipelines not subject to the Security Directive (SD) Pipeline-2021-01 and Pipeline-2021-02 series.<sup>1</sup>

In January 2022, the Cybersecurity and Infrastructure Security Agency (CISA), the Federal Bureau of Investigation, and the National Security Agency issued a joint advisory that focused on the increased cybersecurity threat to surface systems by Russian state-sponsored Advanced Persistent Threat (APT) actors who have demonstrated capability to maintain persistent, long-term access in compromised enterprise and cloud environments.<sup>2</sup> This advisory included specific recommendations to address some of the most common but effective tactics used by this APT actors to gain initial access to targeted networks. These APT tactics include spearphishing, brute force, and exploiting known vulnerabilities against accounts and networks with weak security.

This IC contains four recommended measures for action. First, the designation of a primary and alternate corporate security manager. Second, the reporting of cybersecurity incidents to the Cybersecurity and Infrastructure Security Agency (CISA). Third, the development and implementation of a Cybersecurity Incident Response Plan to reduce the risk of operational disruption in the event that Information Technology and/or Operational Technology systems are affected by a cybersecurity incident. Finally, owner/operators are encouraged to review and implement recommended actions from the Joint Cybersecurity Advisory issued January 11, 2022, by CISA, the Federal Bureau of Investigation and the National Security Agency.<sup>3</sup> The appendix to the IC contains a list of resources to assist you in implementing these recommendations, including TSA's previously issued security guidelines for pipeline owner/operators and relevant cybersecurity advisories.

---

<sup>1</sup> Owner/operators subject to the requirements in these SDs were previously notified by TSA.

<sup>2</sup> See Joint Cybersecurity Advisory, Understanding and Mitigating Russian State-Sponsored Cyber Threats to U.S. Critical Infrastructure, TLP: WHITE, (AA22-011A) (Jan. 11, 2022)

## Information Circular

<u>NUMBER</u>	IC Pipeline-2022-01
<u>SUBJECT</u>	Enhancing Pipeline Cybersecurity
<u>EFFECTIVE DATE</u>	February 16, 2022
<u>EXPIRATION DATE</u>	Indefinite
<u>APPLICABILITY</u>	This Information Circular applies to all Owner/Operators of hazardous liquid and natural gas pipelines not subject to the Security Directive (SD) Pipeline-2021-01 and Pipeline-2021-02 series.
<u>LOCATION</u>	All locations within the United States
<u>SUPERSEDES</u>	N/A

### I. PURPOSE AND GENERAL INFORMATION

TSA is issuing this Information Circular (IC) due to escalating cybersecurity risks. Cybersecurity threats to pipeline critical infrastructure are persistent, and they continue to require a proactive and resilient security posture to reduce the risks of a successful cyber-attack. Pipelines provide vital resources impacting the daily lives of individuals, the national economy, and national security. Technologically sophisticated adversaries have demonstrated the ability and continuing desire to mount cyber-attacks to exploit vulnerabilities in surface transportation security by conducting attacks against the United States and its global interests.

This IC provides recommendations for the development and implementation of security measures for pipeline owner/operators not covered by TSA Pipeline Security Directives (SDs).<sup>1</sup> The security measures provided in this IC are intended to help strengthen the preparedness and mitigation capabilities of this critical sector for the prevention of and response to potential cyber-attacks.

This IC contains four recommended measures. First, the designation of a primary and alternate corporate security manager. Second, the reporting of cybersecurity incidents to the Cybersecurity and Infrastructure Security Agency (CISA). Third, the development and implementation of a Cybersecurity Incident Response Plan to reduce the risk of operational disruption in the event that Information Technology (IT) and/or Operational Technology (OT) systems are affected by a

---

<sup>1</sup> TSA SD Pipeline-2021-01 series and SD Pipeline-2021-02 series.

cybersecurity incident. Finally, owner/operators should review and implement recommended actions from the Joint Cybersecurity Advisory issued January 11, 2022, by CISA, the Federal Bureau of Investigation and the National Security Agency.<sup>2</sup> These measures should be implemented as soon as operationally feasible. Appendix A to this IC provides additional mitigation guidance and recommended practices that are publicly available.

To avoid duplicate reporting, information provided to CISA pursuant to this IC will be shared with TSA and may also be shared with the National Response Center and other agencies as appropriate. Similarly, information provided to TSA pursuant to this IC will be shared with CISA and may also be shared with the National Response Center and other agencies as appropriate.<sup>3</sup> All information reported to TSA or CISA may be sensitive security information subject to the protections of part 1520 of title 49, Code of Federal Regulations.

While these recommendations are guidance and do not impose requirements on any person or company, TSA strongly recommends adoption of the Recommended Measures listed below. The term “should” means that TSA recommends the actions described. Nothing in this document shall supersede any federal statutory or regulatory requirements.

## II. DEFINITIONS

- A. *Cybersecurity incident* means an event that, without lawful authority, jeopardizes, disrupts or otherwise impacts, or is reasonably likely to jeopardize, disrupt or otherwise impact, the integrity, confidentiality, or availability of computers, information or communications systems or networks, physical or virtual infrastructure controlled by computers or information systems, or information resident on the system. This definition includes an event that is under investigation or evaluation by the owner/operator as a possible cybersecurity incident without final determination of the event’s root cause or nature (such as malicious, suspicious, benign).
- B. *Information Technology (IT) System* means any services, equipment, or interconnected systems or subsystems of equipment that are used in the automatic acquisition, storage, analysis, evaluation, manipulation, management, movement, control, display, switching, interchange, transmission, or reception of data or information that fall within the responsibility of the Owner/Operator to operate and/or maintain.
- C. *Operational disruption* means a deviation from or interruption of normal activities or operations that results in a loss of data, system availability, system reliability, or control of systems, or indicates unauthorized access to, or malicious software present on, critical information technology systems.
- D. *Operational Technology (OT) System* is a general term that encompasses several types of control systems, including industrial control systems, supervisory control and data

---

<sup>2</sup> See Joint Cybersecurity Advisory *Understanding and Mitigating Russian State-Sponsored Cyber Threats to U.S. Critical Infrastructure*, January 11, 2022, TLP: WHITE, (AA22-011A).

<https://www.cisa.gov/uscert/ncas/alerts/aa22-011a>

<sup>3</sup> Presidential Policy Directive (PPD)-41 calls for Federal cyber incident response agencies to share incident information with each other to achieve unity of governmental effort. See PPD-41 § III.D.

acquisition systems, distributed control systems, and other control system configurations, such as programmable logic controllers, fire control systems, and physical access control systems, often found in the industrial sector and critical infrastructure. Such systems consist of combinations of programmable electrical, mechanical, hydraulic, pneumatic devices or systems that interact with the physical environment or manage devices that interact with the physical environment.

- E. *Unauthorized Access of an IT or OT System* means access from an unknown or unauthorized source, whether external or internal; access by a third party or former employee; an employee accessing systems for which he or she is not authorized; and may include a non-malicious violation of the Owner/Operators policies, such as the use of shared credential by an employee otherwise authorized to access the system.

### III. RECOMMENDED MEASURES

#### A. Corporate Security Manager

1. Assign a qualified primary and alternate staff member to manage the corporate security program.<sup>4</sup>
2. Provide in writing to TSA, at [SurfOps-SD@tsa.dhs.gov](mailto:SurfOps-SD@tsa.dhs.gov), the names, titles, phone number(s), and email address(es) of the primary and alternate corporate security manager and notify TSA as soon as practicable of any updates to the information when there are changes. TSA will use this information to provide pipeline owner/operators with relevant security information and threat updates.<sup>5</sup>

#### B. Reporting Cybersecurity Incidents

1. Report cybersecurity incidents to CISA involving systems that the Owner/Operator has responsibility to operate and/or maintain including:
  - a. Unauthorized access of an IT or OT system;
  - b. Discovery of malicious software on an IT or OT system;
  - c. Activity resulting in a denial of service to any IT or OT system; and/or
  - d. Any other cybersecurity incident that results in operational disruption to the Owner/Operator's IT or OT systems or other aspects of the Owner/Operator's systems or facilities, or an incident that has the potential to cause impact to critical infrastructure or core government functions, or impacts national security, economic security, or public health and safety.

---

<sup>4</sup> See TSA's Pipeline Security Guidelines, March 2018 (with change 1 (April 2021)) for more information about the role and importance of corporate security managers.

[https://www.tsa.gov/sites/default/files/pipeline\\_security\\_guidelines.pdf](https://www.tsa.gov/sites/default/files/pipeline_security_guidelines.pdf)

<sup>5</sup> This collection of information is approved by the Office of Management and Budget (OMB) under OMB Control No. 1652-0055.

2. Owner/Operators should report the incidents identified by this section as soon as practicable, but no later than 24 hours after a cybersecurity incident is identified.
3. Reports recommended by this section should be made to CISA Central using CISA's Reporting System form at: <https://us-cert.cisa.gov/forms/report> or by calling (888) 282-0870. TSA and CISA will protect all information in a manner appropriate for the sensitivity and criticality of the information.<sup>6</sup>
4. The report to CISA should include the following information, as available to the reporting Owner/Operator at the time of the report:
  - a. The name of the reporting individual and contact information, including a telephone number and email address.
  - b. The affected hazardous liquid and natural gas pipeline(s) or facilities, including identifying information and location.
  - c. Description of the threat, incident, or activity, to include:
    - i. Earliest known date of compromise;
    - ii. Date of Detection;
    - iii. Information about who has been notified and what action has been taken;
    - iv. Any relevant information observed or collected by the Owner/Operators, such as malicious IP addresses, malicious domains, malware hashes and/or samples, or the abuse of legitimate software or accounts; and
    - v. Any known threat information, to include information about the source of the threat or attack, if available.
  - d. A description of the incident's impact or potential impact on IT or OT systems and operations. This information should also include an assessment of actual or imminent adverse impacts to service operations, operational delays, and/or data theft that have or are likely to be incurred, as well as any other information that would be informative in understanding the impact or potential impact of the cybersecurity incident.
  - e. A description of all responses that are planned or under consideration. Any additional relevant information. If all the requested information is not available at the time of reporting, Owner/Operators should submit an initial report within the specified timeframe and supplement as additional information becomes available.

---

<sup>6</sup> CISA's Incident Reporting System provides a secure web-enabled means of reporting computer security incidents to CISA. Information collected through this system is approved under OMB Control No. 1670-0037.

### C. Develop and Implement a Cybersecurity Incident Response Plan

1. As soon as practicable, Owner/Operators should develop and adopt a Cybersecurity Incident Response Plan that includes measures to reduce the risk of operational disruption, or other significant business or functional degradation, in the event of a cybersecurity incident. The Cybersecurity Incident Response Plan should provide specific measures sufficient to ensure the following objectives are achieved, as technically applicable and feasible:
  - a. Prompt identification, isolation, and segregation of the infected systems from uninfected systems, networks, and devices to prioritize:
    - i. Limiting the spread of autonomous malware;
    - ii. Denying continued attacker access to systems;
    - iii. Determining extent of compromise; and
    - iv. Preservation of evidence or partially encrypted data system storage.
  - b. Security and integrity of backed-up data, including measures to secure and safely maintain backups outside of the production environment, and implement procedures requiring scanning of stored backup data with host security software to check that it is free of malicious artifacts when the backup is made and when tested for restoration.
  - c. Established capability and governance for isolating the IT and OT systems in the event of a cybersecurity incident that rises to the level of potential operational disruption while maintaining operational standards and limits.
2. The Cybersecurity Incident Response Plan should, at a minimum, identify who (by position) is responsible for implementing the specific measures and any necessary resources needed to implement these measures.
3. The Owner/Operator should conduct situational exercises to test the effectiveness of procedures, and personnel responsible for implementing measures, in the Cybersecurity Incident Response Plan.

D. Review and, as appropriate, implement the recommended actions in the Joint Cybersecurity Advisory *Understanding and Mitigating Russian State-Sponsored Cyber Threats to U.S. Critical Infrastructure*.<sup>7</sup>

# JOINT CYBERSECURITY ADVISORY

Co-Authored by:

TLP:WHITE

Product ID: AA22-011A

January 11, 2022

## Understanding and Mitigating Russian State-Sponsored Cyber Threats to U.S. Critical Infrastructure

### SUMMARY

This joint Cybersecurity Advisory (CSA)—authored by the Cybersecurity and Infrastructure Security Agency (CISA), Federal Bureau of Investigation (FBI), and National Security Agency (NSA)—is part of our continuing cybersecurity mission to warn organizations of cyber threats and help the cybersecurity community reduce the risk presented by these threats. This CSA provides an overview of Russian state-sponsored cyber operations; commonly observed tactics, techniques, and procedures (TTPs); detection actions; incident response guidance; and mitigations. This overview is intended to help the cybersecurity community reduce the risk presented by these threats.

CISA, the FBI, and NSA encourage the cybersecurity community—especially critical infrastructure network defenders—to adopt a heightened state of awareness and to conduct proactive threat hunting, as outlined in the [Detection](#) section. Additionally, CISA, the FBI, and NSA strongly urge network defenders to implement the recommendations listed below and detailed in the [Mitigations](#) section. These mitigations will help organizations improve their functional resilience by reducing the risk of compromise or severe business degradation.

Actions critical infrastructure organizations should implement to immediately strengthen their cyber posture.

- Patch all systems. Prioritize patching [known exploited vulnerabilities](#).
- Implement multi-factor authentication.
- Use antivirus software.
- Develop internal contact lists and surge support.

---

To report suspicious or criminal activity related to information found in this Joint Cybersecurity Advisory, contact your local FBI field office at [fbi.gov/contact-us/field](https://www.fbi.gov/contact-us/field), or the FBI's 24/7 Cyber Watch (CyWatch) at (855) 292-3937 or by e-mail at [CyWatch@fbi.gov](mailto:CyWatch@fbi.gov). When available, please include the following information regarding the incident: date, time, and location of the incident; type of activity; number of people affected; type of equipment used for the activity; the name of the submitting company or organization; and a designated point of contact. To request incident response resources or technical assistance related to these threats, contact CISA at [CISAServiceDesk@cisa.dhs.gov](mailto:CISAServiceDesk@cisa.dhs.gov). For NSA client requirements or general cybersecurity inquiries, contact the Cybersecurity Requirements Center at 410-854-4200 or [Cybersecurity\\_Requests@nsa.gov](mailto:Cybersecurity_Requests@nsa.gov).

This document is marked TLP:WHITE. Disclosure is not limited. Sources may use TLP:WHITE when information carries minimal or no foreseeable risk of misuse, in accordance with applicable rules and procedures for public release. Subject to standard copyright rules, TLP:WHITE information may be distributed without restriction. For more information on the Traffic Light Protocol, see [cisa.gov/tlp/](https://www.cisa.gov/tlp/).

TLP:WHITE

1. **Be prepared.** Confirm reporting processes and minimize personnel gaps in IT/OT security coverage. Create, maintain, and exercise a cyber incident response plan, resilience plan, and continuity of operations plan so that critical functions and operations can be kept running if technology systems are disrupted or need to be taken offline.
2. **Enhance your organization's cyber posture.** Follow best practices for identity and access management, protective controls and architecture, and vulnerability and configuration management.
3. **Increase organizational vigilance.** Stay current on reporting on this threat. [Subscribe](#) to CISA's [mailing list and feeds](#) to receive notifications when CISA releases information about a security topic or threat.

CISA, the FBI, and NSA encourage critical infrastructure organization leaders to review CISA Insights: [Preparing for and Mitigating Cyber Threats](#) for information on reducing cyber threats to their organization.

## TECHNICAL DETAILS

**Note:** this advisory uses the MITRE ATT&CK® for Enterprise framework, version 10. See the [ATT&CK for Enterprise](#) for all referenced threat actor tactics and techniques.

Historically, Russian state-sponsored advanced persistent threat (APT) actors have used common but effective tactics—including spearphishing, brute force, and exploiting known vulnerabilities against accounts and networks with weak security—to gain initial access to target networks. Vulnerabilities known to be exploited by Russian state-sponsored APT actors for initial access include:

- [CVE-2018-13379](#) FortiGate VPNs
- [CVE-2019-1653](#) Cisco router
- [CVE-2019-2725](#) Oracle WebLogic Server
- [CVE-2019-7609](#) Kibana
- [CVE-2019-9670](#) Zimbra software
- [CVE-2019-10149](#) Exim Simple Mail Transfer Protocol
- [CVE-2019-11510](#) Pulse Secure
- [CVE-2019-19781](#) Citrix
- [CVE-2020-0688](#) Microsoft Exchange
- [CVE-2020-4006](#) VMWare (note: this was a zero-day at time.)
- [CVE-2020-5902](#) F5 Big-IP
- [CVE-2020-14882](#) Oracle WebLogic
- [CVE-2021-26855](#) Microsoft Exchange (Note: this vulnerability is frequently observed used in conjunction with [CVE-2021-26857](#), [CVE-2021-26858](#), and [CVE-2021-27065](#))

Russian state-sponsored APT actors have also demonstrated tradecraft and cyber capabilities by compromising third-party infrastructure, compromising third-party software, or developing and deploying custom malware. The actors have also demonstrated the ability to maintain persistent, undetected, long-term access in compromised environments—including cloud environments—by using legitimate credentials.

In some cases, Russian state-sponsored cyber operations against critical infrastructure organizations have specifically targeted operational technology (OT)/industrial control systems (ICS) networks with destructive malware. See the following advisories and alerts for information on historical Russian state-sponsored cyber-intrusion campaigns and customized malware that have targeted ICS:

- ICS Advisory [ICS Focused Malware – Havex](#)
- ICS Alert [Ongoing Sophisticated Malware Campaign Compromising ICS \(Update E\)](#)
- ICS Alert [Cyber-Attack Against Ukrainian Critical Infrastructure](#)
- Technical Alert [CrashOverride Malware](#)
- CISA MAR [HatMan: Safety System Targeted Malware \(Update B\)](#)
- CISA ICS Advisory [Schneider Electric Triconex Tricon \(Update B\)](#)

Russian state-sponsored APT actors have used sophisticated cyber capabilities to target a variety of U.S. and international critical infrastructure organizations, including those in the Defense Industrial Base as well as the Healthcare and Public Health, Energy, Telecommunications, and Government Facilities Sectors. High-profile cyber activity publicly attributed to Russian state-sponsored APT actors by U.S. government reporting and legal actions includes:

- **Russian state-sponsored APT actors targeting state, local, tribal, and territorial (SLTT) governments and aviation networks, September 2020, through at least December 2020.** Russian state-sponsored APT actors targeted dozens of SLTT government and aviation networks. The actors successfully compromised networks and exfiltrated data from multiple victims.
- **Russian state-sponsored APT actors' global Energy Sector intrusion campaign, 2011 to 2018.** These Russian state-sponsored APT actors conducted a multi-stage intrusion campaign in which they gained remote access to U.S. and international Energy Sector networks, deployed ICS-focused malware, and collected and exfiltrated enterprise and ICS-related data.
- **Russian state-sponsored APT actors' campaign against Ukrainian critical infrastructure, 2015 and 2016.** Russian state-sponsored APT actors conducted a cyberattack against Ukrainian energy distribution companies, leading to multiple companies experiencing unplanned power outages in December 2015. The actors deployed [BlackEnergy](#) malware to steal user credentials and used its destructive malware component, KillDisk, to make infected computers inoperable. In 2016, these actors conducted a cyber-intrusion campaign against a Ukrainian electrical transmission company and deployed [CrashOverride](#) malware specifically designed to attack power grids.

For more information on recent and historical Russian state-sponsored malicious cyber activity, see the referenced products below or [cisa.gov/Russia](https://cisa.gov/Russia).

- Joint FBI-DHS-CISA CSA [Russian Foreign Intelligence Service \(SVR\) Cyber Operations: Trends and Best Practices for Network Defenders](#)
- Joint NSA-FBI-CISA CSA [Russian GRU Conducting Global Brute Force Campaign to Compromise Enterprise and Cloud Environments](#)

- Joint FBI-CISA CSA [Russian State-Sponsored Advanced Persistent Threat Actor Compromises U.S. Government Targets](#)
- Joint CISA-FBI CSA [APT Actors Chaining Vulnerabilities against SLTT, Critical Infrastructure, and Elections Organizations](#)
- CISA's webpage [Remediating Networks Affected by the SolarWinds and Active Directory/M365 Compromise](#)
- CISA Alert [Russian Government Cyber Activity Targeting Energy Sector and Other Critical Infrastructure Sectors](#)
- CISA ICS: Alert [Cyber-Attack Against Ukrainian Critical Infrastructure](#)

Table 1 provides common, publicly known TTPs employed by Russian state-sponsored APT actors, which map to the MITRE ATT&CK for Enterprise framework, version 10. **Note:** these lists are not intended to be all inclusive. Russian state-sponsored actors have modified their TTPs before based on public reporting.[1] Therefore, CISA, the FBI, and NSA anticipate the Russian state-sponsored actors may modify their TTPs as they deem necessary to reduce their risk of detection.

Table 1: Common Tactics and Techniques Employed by Russian State-Sponsored APT Actors

Tactic	Technique	Procedure
Reconnaissance <a href="#">[TA0043]</a>	Active Scanning: Vulnerability Scanning <a href="#">[T1595.002]</a>	Russian state-sponsored APT actors have performed large-scale scans in an attempt to find vulnerable servers.
	Phishing for Information <a href="#">[T1598]</a>	Russian state-sponsored APT actors have conducted spearphishing campaigns to gain credentials of target networks.
Resource Development <a href="#">[TA0042]</a>	Develop Capabilities: Malware <a href="#">[T1587.001]</a>	Russian state-sponsored APT actors have developed and deployed malware, including ICS-focused destructive malware.
Initial Access <a href="#">[TA0001]</a>	Exploit Public Facing Applications <a href="#">[T1190]</a>	Russian state-sponsored APT actors use publicly known vulnerabilities, as well as zero-days, in internet-facing systems to gain access to networks.
	Supply Chain Compromise: Compromise Software Supply Chain <a href="#">[T1195.002]</a>	Russian state-sponsored APT actors have gained initial access to victim organizations by compromising trusted third-party software. Notable incidents include M.E.Doc accounting software and SolarWinds Orion.
Execution <a href="#">[TA0002]</a>	Command and Scripting Interpreter: PowerShell <a href="#">[T1059.003]</a> and	Russian state-sponsored APT actors have used <code>cmd.exe</code> to execute commands on remote machines. They have also used PowerShell to create new tasks on remote machines,

Tactic	Technique	Procedure
	Windows Command Shell <a href="#">[T1059.003]</a>	identify configuration settings, exfiltrate data, and to execute other commands.
Persistence <a href="#">[TA0003]</a>	Valid Accounts <a href="#">[T1078]</a>	Russian state-sponsored APT actors have used credentials of existing accounts to maintain persistent, long-term access to compromised networks.
Credential Access <a href="#">[TA0006]</a>	Brute Force: Password Guessing <a href="#">[T1110.001]</a> and Password Spraying <a href="#">[T1110.003]</a>	Russian state-sponsored APT actors have conducted brute-force password guessing and password spraying campaigns.
	OS Credential Dumping: NTDS <a href="#">[T1003.003]</a>	Russian state-sponsored APT actors have exfiltrated credentials and exported copies of the Active Directory database <code>ntds.dit</code> .
	Steal or Forge Kerberos Tickets: Kerberoasting <a href="#">[T1558.003]</a>	Russian state-sponsored APT actors have performed “Kerberoasting,” whereby they obtained the Ticket Granting Service (TGS) Tickets for Active Directory Service Principal Names (SPN) for offline cracking.
	Credentials from Password Stores <a href="#">[T1555]</a>	Russian state-sponsored APT actors have used previously compromised account credentials to attempt to access Group Managed Service Account (gMSA) passwords.
	Exploitation for Credential Access <a href="#">[T1212]</a>	Russian state-sponsored APT actors have exploited Windows Netlogon vulnerability <a href="#">CVE-2020-1472</a> to obtain access to Windows Active Directory servers.
	Unsecured Credentials: Private Keys <a href="#">[T1552.004]</a>	Russian state-sponsored APT actors have obtained private encryption keys from the Active Directory Federation Services (ADFS) container to decrypt corresponding SAML signing certificates.
	Command and Control <a href="#">[TA0011]</a>	Proxy: Multi-hop Proxy <a href="#">[T1090.003]</a>

For additional enterprise TTPs used by Russian state-sponsored APT actors, see the ATT&CK for Enterprise pages on [APT29](#), [APT28](#), and the [Sandworm Team](#), respectively. For information on ICS

TLP:WHITE

TTPs see the [ATT&CK for ICS](#) pages on the [Sandworm Team](#), [BlackEnergy 3](#) malware, [CrashOverride](#) malware, BlackEnergy's [KillDisk](#) component, and [NotPetya](#) malware.

## DETECTION

Given Russian state-sponsored APT actors demonstrated capability to maintain persistent, long-term access in compromised enterprise and cloud environments, CISA, the FBI, and NSA encourage all critical infrastructure organizations to:

- **Implement robust log collection and retention.** Without a centralized log collection and monitoring capability, organizations have limited ability to investigate incidents or detect the threat actor behavior described in this advisory. Depending on the environment, examples include:
  - Native tools such as M365's Sentinel.
  - Third-party tools, such as Sparrow, Hawk, or CrowdStrike's Azure Reporting Tool (CRT), to review Microsoft cloud environments and to detect unusual activity, service principals, and application activity. **Note:** for guidance on using these and other detection tools, refer to CISA Alert [Detecting Post-Compromise Threat Activity in Microsoft Cloud Environments](#).
- **Look for behavioral evidence or network and host-based artifacts** from known Russian state-sponsored TTPs. See table 1 for commonly observed TTPs.
  - To detect password spray activity, review authentication logs for system and application login failures of valid accounts. Look for multiple, failed authentication attempts across multiple accounts.
  - To detect use of compromised credentials in combination with a VPS, follow the below steps:
    - Look for suspicious "impossible logins," such as logins with changing username, user agent strings, and IP address combinations or logins where IP addresses do not align to the expected user's geographic location.
    - Look for one IP used for multiple accounts, excluding expected logins.
    - Look for "impossible travel." Impossible travel occurs when a user logs in from multiple IP addresses that are a significant geographic distance apart (i.e., a person could not realistically travel between the geographic locations of the two IP addresses during the time period between the logins). **Note:** implementing this detection opportunity can result in false positives if legitimate users apply VPN solutions before connecting into networks.
    - Look for processes and program execution command-line arguments that may indicate credential dumping, especially attempts to access or copy the `ntds.dit` file from a domain controller.
    - Look for suspicious privileged account use after resetting passwords or applying user account mitigations.

- Look for unusual activity in typically dormant accounts.
  - Look for unusual user agent strings, such as strings not typically associated with normal user activity, which may indicate bot activity.
- For organizations with OT/ICS systems:
    - Take note of unexpected equipment behavior; for example, unexpected reboots of digital controllers and other OT hardware and software.
    - Record delays or disruptions in communication with field equipment or other OT devices. Determine if system parts or components are lagging or unresponsive.

## INCIDENT RESPONSE

Organizations detecting potential APT activity in their IT or OT networks should:

1. Immediately isolate affected systems.
2. Secure backups. Ensure your backup data is offline and secure. If possible, scan your backup data with an antivirus program to ensure it is free of malware.
3. Collect and review relevant logs, data, and artifacts.
4. Consider soliciting support from a third-party IT organization to provide subject matter expertise, ensure the actor is eradicated from the network, and avoid residual issues that could enable follow-on exploitation.
5. Report incidents to [CISA](#) and/or the FBI via your [local FBI field office](#) or the FBI's 24/7 CyWatch at (855) 292-3937 or [CyWatch@fbi.gov](mailto:CyWatch@fbi.gov).

**Note:** for OT assets, organizations should have a resilience plan that addresses how to operate if you lose access to—or control of—the IT and/or OT environment. Refer to the [Mitigations](#) section for more information.

See the joint advisory from Australia, Canada, New Zealand, the United Kingdom, and the United States on [Technical Approaches to Uncovering and Remediating Malicious Activity](#) for guidance on hunting or investigating a network, and for common mistakes in incident handling. CISA, the FBI, and NSA encourage critical infrastructure owners and operators to see CISA's [Federal Government Cybersecurity Incident and Vulnerability Response Playbooks](#). Although tailored to federal civilian branch agencies, these playbooks provide operational procedures for planning and conducting cybersecurity incident and vulnerability response activities and detail each step for both incident and vulnerability response.

**Note:** organizations should document incident response procedures in a cyber incident response plan, which organizations should create and exercise (as noted in the [Mitigations](#) section).

## MITIGATIONS

CISA, the FBI, and NSA encourage all organizations to implement the following recommendations to increase their cyber resilience against this threat.

### Be Prepared

#### *Confirm Reporting Processes and Minimize Coverage Gaps*

- Develop internal contact lists. Assign main points of contact for a suspected incident as well as roles and responsibilities and ensure personnel know how and when to report an incident.
- Minimize gaps in IT/OT security personnel availability by identifying surge support for responding to an incident. Malicious cyber actors are [known to target organizations on weekends and holidays](#) when there are gaps in organizational cybersecurity—critical infrastructure organizations should proactively protect themselves by minimizing gaps in coverage.
- Ensure IT/OT security personnel monitor key internal security capabilities and can identify anomalous behavior. Flag any identified IOCs and TTPs for immediate response. (See table 1 for commonly observed TTPs).

#### *Create, Maintain, and Exercise a Cyber Incident Response, Resilience Plan, and Continuity of Operations Plan*

- Create, maintain, and exercise a cyber incident response and continuity of operations plan.
- Ensure personnel are familiar with the key steps they need to take during an incident and are positioned to act in a calm and unified manner. Key questions:
  - Do personnel have the access they need?
  - Do they know the processes?
- For OT assets/networks,
  - Identify a resilience plan that addresses how to operate if you lose access to—or control of—the IT and/or OT environment.
    - Identify OT and IT network interdependencies and develop workarounds or manual controls to ensure ICS networks can be isolated if the connections create risk to the safe and reliable operation of OT processes. Regularly test contingency plans, such as manual controls, so that safety critical functions can be maintained during a cyber incident. Ensure that the OT network can operate at necessary capacity even if the IT network is compromised.
  - Regularly test manual controls so that critical functions can be kept running if ICS or OT networks need to be taken offline.
  - Implement data backup procedures on both the IT and OT networks. Backup procedures should be conducted on a frequent, regular basis. Regularly test backup procedures and ensure that backups are isolated from network connections that could enable the spread of malware.

- In addition to backing up data, develop recovery documents that include configuration settings for common devices and critical OT equipment. This can enable more efficient recovery following an incident.

## Enhance your Organization's Cyber Posture

CISA, the FBI, and NSA recommend organizations apply the best practices below for identity and access management, protective controls and architecture, and vulnerability and configuration management.

### *Identity and Access Management*

- Require multi-factor authentication for all users, without exception.
- Require accounts to have strong passwords and do not allow passwords to be used across multiple accounts or stored on a system to which an adversary may have access.
- Secure credentials. Russian state-sponsored APT actors have demonstrated their ability to maintain persistence using compromised credentials.
  - Use virtualizing solutions on modern hardware and software to ensure credentials are securely stored.
  - Disable the storage of clear text passwords in LSASS memory.
  - Consider disabling or limiting New Technology Local Area Network Manager (NTLM) and WDigest Authentication.
  - Implement Credential Guard for Windows 10 and Server 2016 (Refer to [Microsoft: Manage Windows Defender Credential Guard](#) for more information). For Windows Server 2012R2, enable Protected Process Light for Local Security Authority (LSA).
  - Minimize the Active Directory attack surface to reduce malicious ticket-granting activity. Malicious activity such as "Kerberoasting" takes advantage of Kerberos' TGS and can be used to obtain hashed credentials that attackers attempt to crack.
- Set a [strong](#) password policy for service accounts.
- Audit Domain Controllers to log successful Kerberos TGS requests and ensure the events are monitored for anomalous activity.
  - Secure accounts.
  - Enforce the principle of least privilege. Administrator accounts should have the minimum permission they need to do their tasks.
  - Ensure there are unique and distinct administrative accounts for each set of administrative tasks.
  - Create non-privileged accounts for privileged users and ensure they use the non-privileged accounts for all non-privileged access (e.g., web browsing, email access).

### *Protective Controls and Architecture*

- Identify, detect, and investigate abnormal activity that may indicate lateral movement by a threat actor or malware. Use network monitoring tools and host-based logs and monitoring tools, such as an endpoint detection and response (EDR) tool. EDR tools are particularly

useful for detecting lateral connections as they have insight into common and uncommon network connections for each host.

- Enable strong spam filters.
  - Enable strong spam filters to prevent phishing emails from reaching end users.
  - Filter emails containing executable files to prevent them from reaching end users.
  - Implement a user training program to discourage users from visiting malicious websites or opening malicious attachments.

**Note:** CISA, the FBI, and NSA also recommend, as a longer-term effort, that critical infrastructure organizations implement network segmentation to separate network segments based on role and functionality. Network segmentation can help prevent lateral movement by controlling traffic flows between—and access to—various subnetworks.

- Appropriately implement network segmentation between IT and OT networks. Network segmentation limits the ability of adversaries to pivot to the OT network even if the IT network is compromised. Define a demilitarized zone that eliminates unregulated communication between the IT and OT networks.
- Organize OT assets into logical zones by taking into account criticality, consequence, and operational necessity. Define acceptable communication conduits between the zones and deploy security controls to filter network traffic and monitor communications between zones. Prohibit ICS protocols from traversing the IT network.

## *Vulnerability and Configuration Management*

- Update software, including operating systems, applications, and firmware on IT network assets, in a timely manner. Prioritize patching [known exploited vulnerabilities](#), especially those CVEs identified in this CSA, and then critical and high vulnerabilities that allow for remote code execution or denial-of-service on internet-facing equipment.
  - Consider using a centralized patch management system. For OT networks, use a risk-based assessment strategy to determine the OT network assets and zones that should participate in the patch management program.
  - Consider signing up for CISA's [cyber hygiene services](#), including vulnerability scanning, to help reduce exposure to threats. CISA's vulnerability scanning service evaluates external network presence by executing continuous scans of public, static IP addresses for accessible services and vulnerabilities.
- Use industry recommended antivirus programs.
  - Set antivirus/antimalware programs to conduct regular scans of IT network assets using up-to-date signatures.
  - Use a risk-based asset inventory strategy to determine how OT network assets are identified and evaluated for the presence of malware.
- Implement rigorous configuration management programs. Ensure the programs can track and mitigate emerging threats. Review system configurations for misconfigurations and security weaknesses.

- Disable all unnecessary ports and protocols
  - Review network security device logs and determine whether to shut off unnecessary ports and protocols. Monitor common ports and protocols for command and control activity.
  - Turn off or disable any unnecessary services (e.g., PowerShell) or functionality within devices.
- Ensure OT hardware is in read-only mode.

## Increase Organizational Vigilance

- Regularly review reporting on this threat. Consider [signing up](#) for CISA notifications to receive timely information on current security issues, vulnerabilities, and high-impact activity.

## RESOURCES

- For more information on Russian state-sponsored malicious cyber activity, refer to [cisa.gov/Russia](https://cisa.gov/Russia).
- Refer to CISA Analysis Report [Strengthening Security Configurations to Defend Against Attackers Targeting Cloud Services](#) for steps for guidance on strengthening your organizations cloud security practices.
- Leaders of small businesses and small and local government agencies should see [CISA's Cyber Essentials](#) for guidance on developing an actionable understanding of implementing organizational cybersecurity practices.
- Critical infrastructure owners and operators with OT/ICS networks, should review the following resources for additional information:
  - NSA and CISA joint CSA NSA and CISA Recommend Immediate Actions to Reduce Exposure Across Operational Technologies and Control Systems
  - CISA factsheet [Rising Ransomware Threat to Operational Technology Assets](#) for additional recommendations.

## REWARDS FOR JUSTICE PROGRAM

If you have information on state-sponsored Russian cyber operations targeting U.S. critical infrastructure, contact the Department of State's Rewards for Justice Program. You may be eligible for a reward of up to \$10 million, which DOS is offering for information leading to the identification or location of any person who, while acting under the direction or control of a foreign government, participates in malicious cyber activity against U.S. critical infrastructure in violation of the Computer Fraud and Abuse Act (CFAA). Contact +1-202-702-7843 on WhatsApp, Signal, or Telegram, or send information via the Rewards for Justice secure Tor-based tips line located on the Dark Web. For more details refer to [rewardsforjustice.net/malicious\\_cyber\\_activity](https://rewardsforjustice.net/malicious_cyber_activity).
